MASTER’S PROGRAMME IN MEDICAL PHYSICS

Jointly organised by ICTP and Trieste University

(verification 10/12/2016)

The Master is addressed to students with a MSc in Physics (or equivalent academic degree).

The course, taking into account IAEA and IOMP recommendations, is organised in two years of activities:

- A first year of academic courses and practical exercises in Medical Physics
- A second year of supervised Clinical Training

After the Master, the recommendation is to follow other 1-2 years of Clinical Training in order to be recognised as Clinically Qualified Medical Physicist (CQMP) or a different path according to the requirements of the competent authorities in the Country. The Certification/Registration as Clinically Qualified Medical Physicist (CQMP) has to follow existing State registration rules. IAEA and IOMP are recommending that the competences have to be maintained with a CPD (Continuous Professional Development) programme.

Medical Physics Master - Year 1

The academic education of the first year is covering all the relevant specialties of medical physics to prepare the student to enter in a formal clinical medical physics residency (second year). It will also provide the student with the basic knowledge needed to embark on a career in the regulatory, industry, metrology, research and development or innovation through research sectors, for instance.

The major outcome of the academic programme would be to provide students with a thorough grounding in the physiological basis, analytical methods and fundamental aspects of medical physics and instil an attitude of integrity, professionalism, critical-thinking and scientific rigor.

Teaching is provided both by full time academic staff and by clinical medical physicists and other health care professionals, like radiobiologists, clinicians and regulators.

CORE MODULES

The core modules are provided below, including an outline of their content:

Guided exercises and practicals (228 h):

| P1 | At hospital in radiology, nuclear medicine, radiotherapy and medical physics depts | 3 | 36 | laboratory | written |
| P2 | Radiology                        | 3 | 36 | laboratory | written |
| P3 | Nuclear medicine                | 2 | 24 | laboratory | written |
| P4 | Radiation oncology              | 8 | 96 | laboratory | written |
| P5.1| Information technology and software tools: exercises with ImageJ | 1 | 12 | laboratory | written |
| P5.2| Statistics for medicine         | 1 | 12 | laboratory | written |
| P6 | Montecarlo simulation methods   | 1 | 12 | laboratory | written |

**TOTAL ECTS AND HOURS**

| 60 | 556 |

**European Credit Transfer and Accumulation System (ECTS)** is a standard for comparing the study attainment and performance of students of higher education across the European Union and other collaborating European countries. For successfully completed studies, ECTS credits are awarded. One academic year corresponds to 60 ECTS-credits that are equivalent to 1500–1800 hours of study in all countries irrespective of standard or qualification type and is used to facilitate transfer and progression throughout the Union. Typically, a ECTS is equivalent to 25-30 hours of study.

**L1. Anatomy and Physiology as applied to Medical Physics**

- Anatomical Nomenclature
  - Origin of anatomical names
  - Prefixes and suffixes
  - Anatomical position and body plane terminology

- Structure, Physiology, Pathology, and Radiographic appearance (x-ray, CT, MRI and nuclear medicine imaging) of:
  - Bones and Bone Marrow
  - Brain and CNS
  - Thorax
  - Abdomen
• Pelvis
• Respiratory, Digestive, Urinary, Reproductive, Circulatory, Lymphatic, Endocrine Systems

L2. Radiobiology
  o Classification of Radiation in radiobiology
  o Cell-Cycle and cell death
  o Effect of cellular radiation, oxygen effect
  o Type of radiation damage
  o Cell survival curve
  o Dose-response curve
  o Early and late effects of radiation
  o Modelling, Linear Quadratic Model, α/β Ratio
  o Fractionation, EQD2Gy
  o Dose Rate Effect
  o Tumour Control Probability (TCP), Normal Tissue Complication Probability (NTCP), Equivalent Uniform Dose (EUD)
  o Tolerance Doses and Volumes, Quantitative Analysis of Normal Tissue Effects in the Clinic (QUANTEC) [10]
  o Normal and tumour cell therapeutic ratio
  o Radio-sensitizers, Protectors

L3. Radiation Physics
  o Brief review of quantum mechanics and modern physics
  o X-rays radiology - introduction
  o Passage of the radiation though matter; microscopic treatment
    ▪ coherent and incoherent scattering on atoms
    ▪ photoelectric effect
    ▪ characteristic x-rays
  o Passage of x-rays through matter: macroscopic treatment
    ▪ Filtering
    ▪ X-rays instrumentation
    ▪ Contrast and scattered radiation
  o X-rays detectors
    ▪ Image intensifiers
    ▪ Image screens
    ▪ Digital detectors: computed radiography; the f-centers, direct radiography, indirect conversion methods, direct conversion methods
    ▪ Other digital detectors

L4. Radiation Dosimetry
  o Quantities and Units
Stochastic, non-stochastic quantities
Fluence, Exposure, KERMA, Absorbed dose
Radiation, charged particle equilibrium
Neutron Interactions
Multiple scattering theories
Stopping Power
  - Restricted, Unrestricted
  - Linear Energy Transfer (LET)
Transport Equation
  - Charged Particle slowing down
  - Continuous Slowing Down Approximation (CSDA)
Fano theorem
Cavity Theory
  - Large, small cavity
Radiation Dosimeters and instrumentation
Radiation Standards
Calibration Chain
Absolute dosimetry protocols and IAEA codes of practice

L5. Medical Imaging Fundamentals
Mathematical Methods
Tomographic Reconstruction Techniques
Linear Systems
Acquisition, formation, processing and display of medical images
Perception
Evaluation of Image Quality

L6. Physics of Imaging Detectors
Basics: Introduction to Poisson statistics
Physics of generic photon detectors
  - Quantum efficiency
    • Direct conversion detectors
      o Charge generation and charge collection
    • Indirect conversion detectors
      o Scintillators
  Integrating detectors
  Counting detectors
  Spectroscopic detectors
Sampling
  - Space
  - Time
Noise considerations
- Signal to noise ratio
  - Photon transfer curve
  - Concept of spatial frequency depending detective quantum efficiency
    - Integrating detectors
    - Counting detectors

L7. Physics of Nuclear Medicine
- Short elements of nuclear decays
- Radioisotope imaging generalities
- Images from radioisotopes
- Radioisotopes production
  - Bateman equations
- Radionuclides administration
- The most frequently used radioisotopes
- Imaging Instrumentation
  - Planar, Whole-body
  - SPECT
  - PET
  - Hybrid Imaging
- Medical applications of spect and pet
- Image Quality and noise
- Non-imaging Instrumentation
  - Dose calibrators, Well counters
  - Probes
- Internal Dosimetry
- Quantitative Imaging
- Radionuclide Therapy
- Acceptance testing and commissioning
- Quality management of Nuclear Medicine

L8-L9. Physics of Diagnostic and Interventional Radiology with X-Ray
- Overview of Imaging Modalities (ionizing and non-ionizing)
- X ray Imaging
  - Generation of x-rays, x-ray spectra
  - Detectors
  - Image Parameters
  - Image quality, Noise, contrast, resolution
  - Radiographic, Mammography, Fluoroscopic,
  - CT, DECT, Tomosynthesis
  - Interventional Radiology
  - Dual energy imaging and absorptiometry
  - Patient dose and system optimization

- Ultrasound Imaging
  - Acoustic properties of biological tissues
  - Wave, motion and propagation, acoustic power
  - Modes of Scanning
  - Transducers
  - Doppler
  - Safety
- Magnetic Resonance Imaging (MRI)
  - Physics of Magnetic Resonance
  - MR Image formation
  - MR Instrumentation
  - MRI methods
  - MR contrast and image quality
  - Clinical applications and artefacts
  - Safety

L11-L12. Physics of Radiation Oncology

- Overview of clinical radiotherapy
- Radiation therapy equipment (accelerators, cobalt 60, cyclotrons, kV generators)
- Basic photon radiation therapy (dosimetric functions, etc.)
- Basic treatment planning
- Simulation, virtual simulation, DRR's, image registration
- Patient setup, including positioning and immobilization
- ICRU Reports 50, 62 and 83
- Basic electron radiation therapy, ICRU Report 71
- Kilovoltage radiotherapy
- Dose calculation algorithms and heterogeneity corrections
- Brachytherapy, ICRU Report 38, AAPM TG 43 formalism
  - HDR/LDR, Equipment, Treatment Planning
- Inverse Planning, optimization, IMRT
- Small field dosimetry (fundamental aspects, protocols)
- Small-field radiotherapy equipment and techniques (Stereotactic Radiotherapy and Radiosurgery, Stereotactic Body Radiotherapy, Intensity Modulated Radiotherapy, Tomotherapy™, Cyberknife™, Gammaknife™, etc.)
- Image guidance and verification in radiotherapy (Cone beam CT, ultrasound, Portal imaging, in-vivo dosimetry, image registration)
- Radiation therapy information systems
- Acceptance testing and commissioning
L13-L14. Radiation Protection

- Sources of Radiation
- Activity, half-life, exponential attenuation, half-value layer (HVL), inverse square law, tenth-value layer (TVL)
- Biological Effects of Radiation
- Radiation Quality factor, Equivalent dose, Effective dose
- Legal framework for radiation protection (BSS)
- As low as reasonably achievable (ALARA) concept
- Occupational, public exposure and annual limits
- Radiation protection detectors (Ionization chambers, Geiger-Mueller, Proportional counters, Scintillators, Thermoluminescent Dosimeters (TLDs), neutron detectors)
- Personal and environmental dosimetry
- Shielding calculation
- Radioactive transport and waste management
- Emergency procedures
- Radiation protection programme design, implementation and management in the medical sector

L15. Technology of Information Technology for Medical Physics

- International standards
  - IEC, DICOM, IHE
- HIS/RIS/PACS
- Radiotherapy R&V systems
- Navigation systems
- Registration, segmentation

Seminars covering following topics:

- ICTP and ICTP/IAEA training courses
- Professional and Scientific Development
  - Ethics, professionalism
- Presentation Skills
  - Scientific Communication
  - Techniques of Instruction

PRACTICAL SESSIONS

P1. Practical sessions with a hospital facilities
3 hours sessions to be held at the Trieste Hospital facilities.

<td>Radiation Survey of a clinical installation</td>
<td>Water Tank Scanning of Photons clinical beams</td>
<td>Water Tank Scanning of Electrons clinical beams</td>
<td>QC on Linac</td>
<td>QC on MLC</td>
</tr>
</tbody>
</table>

P2. Radiology
- General radiology: QA, patient dosimetry (software tools)
- Interventional radiology:
  - Equipment QA
  - Procedure optimisation: DRLs, equipment set-up, protocol optimisation
  - Prevention of skin burns: skin dosimetry, trigger level, protocol optimisation, clinical follow-up of high dose patients
- Introduction and use of IDL tools for image analysis

P3. Nuclear Medicine
- Image quality assessment
- QC of nuclear medicine instrumentation
- Patient internal dosimetry (use of software tools)

P4. Radiation Oncology
- Commissioning and basic QC
  - Linac (AAPM TG 106 and 142)
  - Simulators (AAPM RPT 83)
  - Epid
  - kV Imager, R&V
- MU calculation (ESTRO)
- QA of a TPS (AAPM TG43)
- External beam photon therapy planning (ICRU 50 & 62)
- Electron beam electron therapy planning (ICRU71)
- 3DCRT planning
• IMRT/VMAT: Planning (ICRU 83) and QA (included AAPM TG 142)
• Simulation, virtual simulation, DRR’s, image registration, patient setup, including positioning and immobilization
• Image guidance and verification in radiotherapy: cone beam CT, ultrasound, portal imaging, (AAPM TG 179 and 95)
• Multi modality: image registration, motion management
• Brachytherapy planning and QA

P5.1 Information technology and software tools for medical physics
• Programming with ImageJ: quantitative image quality assessment

P5.2 Statistics for Medicine: Statistics as a useful and necessary tool for the health professions.
• Descriptive statistics:
  o Charts /tables, box-plot, measures of central tendency, measures of dispersion and their 'critical' use. Examples and exercises with R in the field of bio-medical.
  o Elements of probability theory: definitions and problems, the conditional probability.
  o Diagnostic tests and ROC curve: Examples and exercises with R
  o Populations of Gaussian data and their properties.
• Elements of statistical inference:
  o Point estimates, estimates of intervals, the 'confidence intervals'. Estimation of the mean of a population of Gaussian data. Examples and exercises with R;
  o Statistical tests: the chi-square test, Fisher’s exact test, the t test Student, Mann-Whitney test and the Wilcoxon test. Examples and exercises with R
  o Risk measures: relative risk (RR) and odds ratio (OR)
  o Linear regression: Examples and exercises with R
• Critical reading of a scientific article

P6. Monte Carlo simulation methods for medical physics
• General Introduction to Monte Carlo methods
• Use of Monte Carlo methods in Medical Physics
• Basic of Monte Carlo simulation within the Geant4 framework
• Practical session of Geant4 simulation
• Basic information about other MC tools
Medical Physics Master - Year 2

Year 2 is devoted to a supervised full time clinical training to be performed in one accredited hospital.
The student should practices covering mainly a specific area of medical physics (medical physics for diagnostic imaging or medical physics for radiation therapy.
Activities to perform, assessment of the skills and competences acquired in each field are adapted from the IAEA and AFRA clinical training of medical physicists guidelines.

<table>

</tr>
</tbody>
</table>

The assignment to hospitals will be not less than 45 weeks (about 1700 hours) that includes the work for the development of the thesis work.

Clinical training content and assessment agreement
Two programmes are identified:
- the first for the training in radiotherapy,
- the second for diagnostic radiology and nuclear medicine.

The content and duration of the clinical training will be tailored to the background and knowledge of the Resident taking into account the following tables.
An individual Portfolio will be developed by the Clinical Medical Physicist Supervisor tailored to the Resident background and knowledge before the beginning of the clinical training.

Radiotherapy

(The training can be expanded up to 36 wks including also PET/CT. The remaining 10 weeks will be devoted to performance testing modules of diagnostic radiology equipment) – Priorities: 1 basic – 4 highest competences
For diagnostic and interventional radiology & nuclear medicine it is stated that the 2 sub-programmes can share equally the time or, in the case of specific resident training needs, a sub-programme can be enlarged maintaining some modules of the second programme that has to be included following the indicated priorities (priority 1 indicate the mandatory module).

The students, at the end of the first year of the Course will be assigned to a hospital of the Network of accredited hospitals.
